Abstract: In pursuit of more balanced regional development, China should base its regional policy during the period of the 12th Five-Year Plan on the principle of fairness, and tailor it to the specific characteristics of needy areas and development priority zones. The country's master plan of developing the western region, revitalizing the northeast, supporting the rise of central China, and upgrading the east should continue.

Key words: regional policy, balanced regional development, development priority zones, needy areas

JEL: R58

1. Introduction

A well-crafted regional policy can further the Chinese central government's goals of balanced regional growth, optimized spatial development, and efficient resource-allocation. Balanced regional development will be an overarching goal during the period of 12th Five Year plan. Therefore, China should continue to improve its regional policy to coordinate development between well-defined priority development zones; intensify interaction between eastern, central and western regions, strengthen public service, and equalize living standards.

2. Evaluation of China's Current Regional Policy

To promote balanced regional development, China has implemented a string of policies including the western development program, revitalization of old industrial bases in the northeast, a strategy to accelerate the rise of the central region, and intensified transfer payments to select areas including former revolutionary bases, regions dominated by ethnic minorities, border areas, and impoverished regions. These policies have yielded positive results. Investment in the central, western, and northeast regions has grown increasingly rapidly; regional economic development has been relatively balanced; and poverty alleviation in the rural areas has been progressing well.

Notably, the disparity between per capita gross regional product (GRP) in the east and west of the country has been shrinking since 2003. Per-capita GRP in the western region was 63.0% lower than that of the east in 2003, but by 2009 the difference had fallen to 55.2% (see Figure 1). The gap between average urban and rural household incomes has been shrinking since 2006, as well (Wei Houkai and Xie Xianshu,
